

Agilent *Medalist* i1000D In-circuit Test System

Data Sheet

The Agilent Medalist i1000D in-circuit tester (ICT) redefines digital testing by bringing electronics manufacturers easy to use and affordable testing for digital devices.

The Agilent *Medalist* i1000D is now even better. Improving from its previous state of an analog-only ICT, the new digital release of the system now features per pin programmable digital cards and a whole new set of intuitive software graphical user interfaces (GUIs) that makes programming and development effortless.

With its new digital capabilities, the *Medalist* i1000D now can perform digital PCF/VCL library based testing, Boundary Scan and I²C/SPI serial programming on a simple, low-cost long-wired test fixture. This presents an excellent opportunity for customers who are looking for better test coverage without any increase in cost.

The digital subsystem of the i1000D harnesses the simplicity and power from the industry-leading *Medalist* i3070 ICT, to bring customers the power to adjust test speeds, drive and receive voltages with just a few clicks of the mouse.

System Highlights

Ease of use

Retaining all the simple yet intuitive features of the earlier U9401/2A model, the new *Medalist* i1000D software adds on to its arsenal with new features that make development and debugging of digital tests as easy as ABC.

Following the development model of a typical Manufacturing Defects Analyzer, the user can now get a fixture and program up and running in just a few days. When digital test is required, simply assign the test libraries and power supplies using the new Developer GUI and let the i1000D software do the rest.

Simplified GUIs allow the user to quickly make changes to individual tests during debug, with a comprehensive set of menus and buttons, complete with AutoDebug features. This allows inexperienced users to start using the system quickly.

With the *Medalist* i1000D, unpowered passive analog components can be debugged with the click of a button, so even someone with limited ICT experience can perform a complete analog test debug in a matter of hours.

AutoDebug fine tunes tests so boards pass reliably in production. Statistical measures (CPK) are employed to determine the stability of the test. This automatic feature can reduce the normal debug process which takes days, to just a few hours.

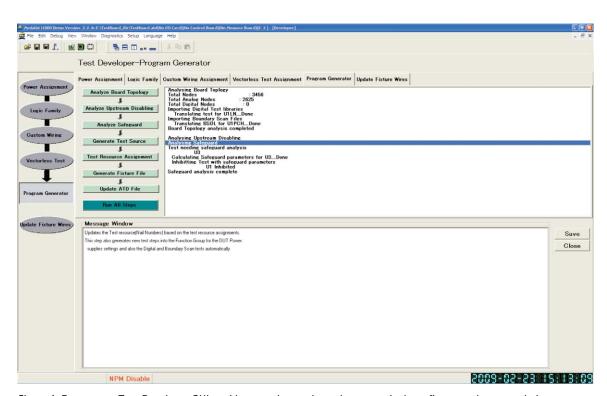

Figure 1. Easy to use Test Developer GUI enables even inexperienced users to deploy a fixture and program in just a few days.

System Highlights

Digital test are usually viewed as complex, difficult to understand and debug by many users. With the i1000D, things are different. The digital debug GUI leverages the control and flexibility of the legendary i3070 PushButton debug GUI, allowing engineers and technicians to have full control of the digital test

parameters and test source codes, yet making it easy to understand. This is achieved by transforming lines of the complicated digital test source codes into simple, easy to understand graphical waveforms. Engineers and technicians performing debug are shielded from the massive lines of codes.

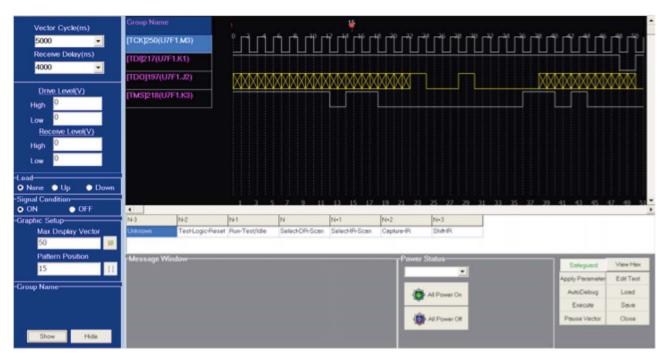

Figure 2. Digital Debugging is made easy on the Medalist i1000D with graphical interface.

VTEP v2.0 Powered Test Suite

Awarded to iVTEP

Manufacturers facing tough time to market pressures can have peace of mind that with the i1000D, they have access to the best vectorless test solutions in the world to help them quickly find defects on digital devices.

The i1000D come with Agilent's award-winning *Medalist* VTEP v2.0 Powered vectorless test suite. This suite comprises Network Parameter Measurement, iVTEP and the original *Medalist* VTEP technology. This powerful suite surpasses the traditional Agilent Testjet capabilities and has been proven to provide better test coverage than tradition digital library tests.

And the innovations do not just stop here.

Cover-Extend technology

Awarded to Cover-Extend Technology

The *Medalist* i1000D is Cover-Extend ready. In Cover-Extend¹ technology, test coverage is no longer limited by test accessibility or library availability. With Cover-Extend, VTEP test can be performed on devices without needing physical test access, thus lowering fixture costs and reducing the number of required test points on the printed circuit board assembly.

Network Parameter Measurement

Awarded to Network Parameter Measurement

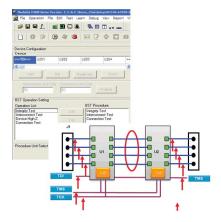

Another industry first, Network Parameter Measurement technology detects defects on power and ground pins while iVTEP focuses on ultra low value measurement of signal pins (< 5fF) on Integrated Circuits (ICs). Furthermore, having the original *Medalist* VTEP as its core means enabling measurements which are 4X more sensitive and 5X better in standard deviation. As technology advances with shrinking packages and faster signaling speeds, VTEP v2.0 is a necessity to meet the challenges of today and beyond.

Automatic guard

The automatic guard feature is a tool for the production test engineer as well as test programmer. It automatically selects different guard points based on board topology for the user during the debug process. This eliminates the need for the user to manually check the schematics for each possible guard point, hence significantly reducing the overall debug time.

Complete Boundary Scan Test Capabilities

Putting even more ICT power in the hands of its users, Agilent has equipped the i1000D with full boundary scan capabilities, from Standard Boundary Scan and Connect test to Interconnect test. These capabilities help satisfy manufacturers' test needs for Boundary Scan enabled devices, and will ensure manufacturers are geared for the future where there will be increased needs to test Intel®-based peripheral control hubs and processors.

Fixturing

Long-wired MDA Press Down fixtures are not suitable for digital tests. Is this true or false?

While it is commonly perceived to be true, the *Medalist* i1000D proves this wrong.

The Medalist i1000D runs digital tests using a traditional MDA-style long-wired press down fixture. Boundary Scan tests, Serial Programming, Library-based tests all run without a glitch. Users now have a test solution that is simple and effective, and at the same time keep their operational costs down with the MDA-style fixtures.

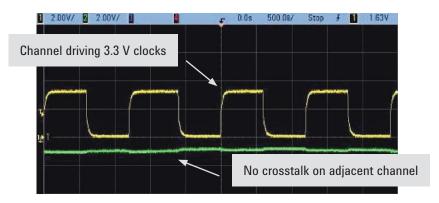

Figure 3. No cross talk on adjacent channels.

Standard software and firmware features		
Open/short testing	Shorts pin groups learning	
Analog testing	Yes	
Vectorless testing	VTEP v2.0	
I ² C programming capability	Yes	
SPI programming capability	Yes	
Boundary scan capability	Yes	
Frequency measurement	Yes	
AC/DC voltage testing	Yes	
Number of analog guarding points	10	
First pass yield report	Yes	
Quality Test CPK Report	Yes	
Component-level coverage report	Yes	
Yield enhancement test	Yes	
Limited access tools	Agilent <i>Medalist</i> Bead Probe Technology Agilent Cover-Extend	
Panel test	Yes	
Relay-level diagnostics tool	Built in	
SPC quality tool	Yes	
Software product VTEP v2.0 test suite Cover-Extend Technology	Test development software for vectorless test extended performance Extending test coverage to devices without test access using VTEP	
Modules and pin cards		
Pin cards	Un-multiplexed analog 128 channel Un-mulitplexed hybrid 64 channel	
Analog stimulus card	Measurement board	
Control card	System control board	
Number of modules	Single module design which supports up to a total of 28 pin cards. This supports up to a total of 3456 node count.	
64 channel hybrid pin card		
Resource per card	Unmuxed 64 channels per card	
Programmable receiver	0 to 4.85 V	
Programmable driver	0 to 5 V	
Max sink current	Peak 500 mA	
Max source current	Peak 500 mA	
Pattern rate	Max 2 MPS	
Programmable vector cycle	Programmable	
Programmable vector cycle resolution	50 ns	
Programmable receive delay	Programmable	
Programmable receive delay resolution	10 ns
