Solid performance in an enhanced platform

The E5061B RF NA options provide high-performance 1- and 2-port network analysis at an affordable price. The established RF performance of the E5061/62A has been integrated into this new digital platform. A wide variety of test set options allows you to select the best configuration to suite your test requirements and budget. Enhanced digital processing capabilities and a smaller footprint improve the throughput and efficiency for testing RF components, including cellular BTS filters/antennas, MRI coils, RFIDs, CATV components, and more.

Wide dynamic range for RF filter measurement (F0 = 1.09 GHz, source = 10 dBm, IFBW = 10 Hz)

Expanded frequency range

An expanded lower-end frequency range down to 100 kHz allows you to test components that require measurements in the 100 kHz range, such as LAN filters and automotive antennas.

Time domain/Fault location analysis (Option E5061B-010)

The time gating function is available in the time domain/ fault-location analysis function. This enables you to eliminate mismatch errors caused by test fixtures when testing CATV cables.

Sweep speed comparison (201 points, 2-port cal, max IFBW)

Time domain analysis for cable

LF-RF NA option (5 Hz to 3 GHz) E5061B-3L5

Comprehensive LF-to-RF network analysis

The E5061B-3L5 LF-RF NA option offers versatile network analysis in the broad frequency range from 5 Hz to 3 GHz. Comprehensive LF network measurement capabilities including built-in 1 M Ω inputs have been seamlessly integrated with the high-performance RF network analyzer. The E5061B-3L5 is the right solution for component and circuit evaluations in the R&D environment.

S-parameter test port

The built-in S-parameter test set of the E5061B-3L5 fully covers 5 Hz to 3 GHz with excellent dynamic range performance. This allows you to evaluate a variety of devices from near DC to RF ranges.

Gain-phase test port

The gain-phase test port provides direct receiver access for LF applications from 5 Hz to 30 MHz. The built-in 1 M Ω inputs allow you to easily perform in-circuit probing measurements for amplifiers and DC-DC converter control loops. The receiver ports can accurately measure amplifier's CMRR/PSRR and PDN milliohm impedance by eliminating the measurement errors associated with the ground loop.

DC bias source

The E5061B-3L5 has a built-in DC bias source which internally superimposes the DC voltage up to \pm 40 Vdc onto the AC source signal at port-1 or LF OUT port. Also, it is possible to provide only the DC voltage from LF OUT port while measuring a DUT at the S-parameter test port.

LF-RF NA option (5 Hz to 3 GHz) E5061B-3L5 + 005 Impedance analysis option

NA plus ZA in one box

The E5061B-005 provides the impedance analysis (ZA) firmware for the E5061B-3L5 LF-RF network analyzer. This option enables the analyzer to measure impedance parameters of electronic components such as capacitors, inductors, and resonators. The combination of NA and ZA capabilities further enhances the analyzer's versatility as a general R&D tool. Basic ZA functionalities including fixture compensation and equivalent circuit analysis are supported by the firmware. The DC biased impedance measurement is possible with the built-in DC bias source provided by the E5061B-3L5.

Wide application coverage

The E5061B-005 supports reflection, series-thru, and shunt-thru methods using the S-parameter test port or gain-phase test port. These methods are ideally suitable for low-to-middle, middle-to-high, and very low milliohm impedance ranges. You can evaluate a broad range of components by selecting appropriate measurement methods.

Test fixtures

For the port-1 reflection method and the gain-phase series-thru method, you can use Agilent's 7 mm and 4TP (4-terminal-pair) component test fixtures. The 7 mm fixtures are connected to the port-1 via the 16201A terminal adapter, and the 4TP fixtures are directly connected to the gain-phase test port.
